1. General

The data exchange between the Computing Head and host system takes place using 4-wire half-duplex transmission or the standard RS485, at a baud rate of 2400. Data is received according to appropriate hardware and software protections.

In addition to hardware protections, the security of the data exchange is also ensured by the structure of the messages and redundancies contained therein.

The Computing Head is generally in receive mode: each block of data sent by the host has a synchronization word placed at the beginning of the block, i.e. a word containing the null character. If the host is in receive mode, the message is valid only if it arrives within a given time-frame and contains all the necessary redundancies.

There are three types of controls:

- use of a parity bit: this provides protection against all odd errors;
- all words containing data transmitted by the Computing Head are followed by their complement to 255;
- all commands received from the host undergo the following procedure:
 - 1.transmission of address with function code (see attached table) and command code;
 - 2.echo response for entire message;
 - 3.transmission of execution by host;
 - 4.execution acknowledgement response.

1.1 Notes

The following sections describe the standard working of Nuovo Pignone Dispenser Protocol. It is possible, for some software version, not to have some features or to behave in a different way from the standard one.

In any case the document highlights the behaviour which can be different.

2. Functional Specifications

The electrical specifications relative to the Computing Head-host connection are as follows:

- Asynchronous
- Speed: 2400 Baud
- data: 8 bit
- parity: odd
- start: 1 bit
- stop: 1 bit

All host-generated communications start with a null word which serves as a preamble to all host transmissions, to synchronize the start of the message; response messages do not have a preamble.

There are four types of messages:

- INITIALIZATION
- DATA REQUEST
- COMMANDS
- EXECUTION

2.1 Timers

The response time for the computing head is less than 50 mS, i.e. the host can set the response timeout for each message at 50 mS. After this time has elapsed, the computing head will not answer any more.

4	Errata corripge pages 30 and 31.	11.12.00	COMM. - JOB

Il presente documento è di proprietà NUOVO PIGNONE - A termini di legge ogni diritto è riservato		SOSTITUISCE IL - SOSTITUITO DA -	

3. Initialization

On the host side, the message basically has a system self-configuration function. The actual functions performed are the following:

- detection of active Computing Head (or non-active Computing Head)
- assignment of the address to the Computing Head being called (only with the 4 wire NP Standard - not with the RS485 standard)
- acquisition of the configuration of the connected Computing Head

When the initialization message is received by the Computing Head, it performs the following functions:

- address storage (in ADDRESS and ADDRESS double buffer);
- configuration response;
- set-up for management of subsequent connections.

The initialization function procedure does not require the Computing Head to modify the current procedure (for instance, if the computing head is delivering, it will continue to deliver).

FORMAT

HOST

0	W1T	W2T
---	-----	-----

COMPUTING HEAD

W1T	W2R	W2R
-----	-----	-----

W1T: X X X X X 1 1 1 with XXXXX Computing Head address

W2T: X X X X X 0 0 0

W2R: 0 0 0 1 X X X X

The most significant nibble field of the W2R byte contains:

- value 0001, if the Computing Head is Single-Product (i.e. Computing Head peripheral code);
- binary coding of the existing number of products, if the Computing Head is Multi-Product.

The first four bits have the following meaning:

bit 3: when set, indicates that the Computing Head is equipped with an electromechanical totalizer;
bit 2: when set, indicates that the Computing Head is able to deliver blended petrol;
bit 1: when set, indicates that the Computing Head may be pre-set;
bit 0: when set at 1, indicates that the Computing Head is not fitted with an anti-spill device.

The initialization message is also used to restore Computing Head function after a block or error situation (regardless of whether the interrupt was caused by the host, the Computing Head or the nozzle).

SOSTITUITO DA -

4. Data Request

The following data is provided by the Computing Head to the host:

- Status 1
- Status 2
- Status 3 (for dispensers with max. 4 products)
- Status 4 (for dispensers with 5 or 6 products)
- Single Product Unit Price
- Blend (5 percentages) or Multi Product (max. 4 products) Prices
- Multi Product Prices (5/6 products)
- Blend Percentage
- Delivery Data
- Delivery Amount
- Delivery Volume
- Overall Total Volume
- Overall Total Amount
- Non-Compensated Volume
- Temperature

In the following subsections there are the complete requests specifications (length, data format, action to be taken).

4.1 Status 1 Request

The message serves to up-date the host as to the status of the pump and the Computing Head.
When it receives this message, the Computing Head

- transmits the status byte,
- turns on the green light on the distributor if the following conditions are met:
- no error present (bit 0 status word = 0)
- nozzle replaced correctly (bit 3 status word = 0)
- metric tests not under way (bit 5 status word = 0)
- no host-generated block (bit 7 status word = 0).

FORMAT

HOST

0	W1T
---	-----

COMPUTING HEAD

W1T	W1R	W1R
-----	-----	-----

W1T: X X X X X 0 0 1 with XXXXX Computing Head address

W1R: Y - Y Y Y Y Y Y

If the bits are set to 1, the meaning of W1R is the following:

- bit 7:** host generated block
- bit 6:** used only in the first status request after an initialization message to signal that the computing head belongs to NPT (new releases) or OTP series.
- bit 5:** metric tests under way
- bit 4:** local price change under way
- bit 3:** nozzle out
- bit 2:** low level status
- bit 1:** contactor (motor) ON
- bit 0:** error status

If bit 0 equals 1, the most significant nibble contains the error code.

4.2 Status 2 Request

The purpose of the message is to enable the host to up-date the status of the pump and Computing Head.
When it receives this message, the Computing Head

- transmits the status byte,
- turns on the red light on the distributor if the following conditions are met:
- no error present (bit 0 status word = 0)
- nozzle replaced correctly (bit 3 status word = 0)
- metric tests not under way (bit 5 status word = 0)
- no host-generated interrupt (bit 7 status word = 0).

Unlike status 1, this message is sent by the host under delivery conditions or after having sent a pre-set command so that the distributor is considered as being engaged.

4.3 Status 3 Request

This message is used only in the case of a multi-product Computing Head. It is sent by the host only when the following conditions are met:

- there is a change in the status byte (in response to a status 1 or status 2 request)
- the computing head is delivering under a preset condition. In this situation it is permitted for the user to change the nozzle if the delivery has not reached 40 centiliters.

Status 3 contains information about the four products, specifically:

- contactor
- low level
- nozzle out
- nozzle blocked

4.11 Delivery Volume Request

The message serves to provide up-dated information in real time as to the volume delivered at the Computing Head.

The functions performed on the Computing Head are those related to the response procedure.

The data transmitted to the host are identical to those displayed on the Computing Head.

FORMAT
